This electronically-powered machinery is also called a stock picker and is like a forklift, enabling a person to get into high up places on a platform. The operator's platform is situated near the floor. From there, the operator directs the unit backward, forward or from side to side, and lifts the tines to the appropriate level required for the task. To access materials on a high shelf, the platform is elevated. The unit has a counterweight on the other end to provide balance.

Once the materials have been picked, the individual is lowered on the platform and the unit is driven to the next site. Some businesses have policies against moving the order picker while the platform is elevated. Though the unit can be used to place pallets on a shelf, lift trucks and stackers are more often made use of for to stack pallets.

As the unit is powered electrically, the battery should be recharged quite regularly. This is a factor in factories and warehouses which run multiple shifts. Extra batteries can be bought if the unit is in use during back-to-back shifts.

Prior to choosing an order picker, it is advisable to check the battery capacities of the particular models. Different pickers have their own weight limits and reach limitations. Different order picker models have different travel and lift speeds. The fork size also varies. Most order pickers have a fork size of approximately 1.5 m. While higher lift and travel speeds can help increase production, they can also cause more accidents. Operators utilizing order pickers should be trained well on the particular units they would be operating.
